

# build

---

**build**(mdl: Buildable): any

Creates a buildable model by extending a base model and merging the given object into it. Accepts two parameters.

- **mdl**: The buildable model to generate mock data from.
- **returns** the generated mock data.

## Example

```
const $Person = model({
  name: oneOf(['Sara', 'Peter']),
  age: range(1, 92),
});

const person = build($Person);
// => {
//   name: 'Peter',
//   age: 21,
// }
```
