canBe

```
canBe(value: any, likelihood = 0.5): void
```

This processor replaces the value of the builder function it is attached to based on a given likelihood. canBe accepts as first parameter the replacement-value and as a second, the likelihood with which the regular value will be replaced.

Example

```
const $Person = model({
  driverLicense: use($DriverLicense, canBe(null, 0.7))
});
```
